SUMMARY

Full-stack web developer (Uplift Code Camp, Batch 29) with more than five years running SEO and digital marketing for 100+ brands. I build React and Node applications end to end, then apply what I know about search, analytics, and conversion so the sites I ship actually get found and get used. Comfortable owning a project from data model to deployment, with a habit of writing tests and reading logs before guessing.

SKILLS

Front End: HTML, CSS, JavaScript, React, Redux Toolkit, React Router, Vite, Responsive Design, Netlify

Back End: Node.js, Express, RESTful APIs, Socket.io, JSON Web Tokens, bcrypt, helmet, cors, dotenv, Render

Databases: MongoDB Atlas, Mongoose, aggregation pipelines, Local Storage

Testing and Tools: Cypress end-to-end testing, Git, GitHub, GitLab, npm, VS Code, Postman

CMS and Platforms: Wordpress, Webflow, Shopify, Drupal, Payload CMS, GoHighLevel

Automations: Make, Zapier, n8n, GHL Workflows, Google App Scripts, API Integrations

SEO and Analytics: Technical SEO, keyword research, GA4, Google Search Console, Google Business Profile, Meta Ads, R programming, Core Web Vitals

PROJECTS

Logix WMS, Pharmaceutical Warehouse Management System

Team Capstone, Uplift Code Camp • logix-wms-frontend.onrender.com • github.com/littlenutbrownhare/Logix-WMS • MERN stack, Socket.io

- Built a centralized warehouse management system for pharmaceutical inventory as part of a group capstone team, replacing scattered spreadsheet tracking with one shared, real-time stock record on React, Node.js, Express, and MongoDB Atlas.
- Implemented FEFO (First Expired, First Out) enforcement on stock movement plus automated expiry alerts, so soon-to-expire batches leave the warehouse before newer stock can be picked.
- Added role-based access control so warehouse staff, encoders, and admins each see only the actions their role permits, with JWT authentication guarding private routes.
- Recorded every stock movement in a full audit trail and generated billing and delivery documents straight from warehouse data, cutting manual paperwork out of the dispatch flow.
- Wired Socket.io into the stack so inventory changes made by one user appear for everyone else without a refresh, then deployed the frontend and API to Render against a shared Atlas cluster.

RollbackHQ, an Undo Button for AI (Frontend)

Solo Development • rollbackhq.netlify.app • React, Redux Toolkit, Cypress

- Built a safety dashboard that catches faulty AI-driven data changes: every proposal is snapshotted, validated against a configurable percent threshold, and routed to a human for approval, with one-click rollback to any saved version.
- Structured all application state in a single Redux store with five slices (records, changes, snapshots, audit log, settings) so KPI counters across five routed pages stay in sync from one source of truth.
- Wrote the validation rule engine as a pure function separate from the UI, which later moved to the server almost unchanged.
- Added Cypress end-to-end tests that caught a real production bug my manual testing missed: a missing import that only crashed on a 30% random code path.
- Persisted the full store to Local Storage with a single store subscription, then deployed to Netlify with a redirects rule so React Router paths survive a page refresh.
- Wrote up the build process in a technical article on DEV Community covering the data model, state design, and testing lessons.

RollbackHQ API (Backend)

Solo Development • Node.js, Express, MongoDB Atlas, JWT

- Rebuilt the safety layer as a real API on the principle that clients propose and the server decides: all rules, writes, and attribution live server-side.
- Implemented registration and login with bcrypt password hashing and JWT tokens, plus a protect middleware gate on every private route.
- Designed the approval endpoint so one request updates three entities atomically: the record value, the change status attributed to the deciding user, and a new audit log entry, with a 409 guard against double decisions.
- Built an AI Trust Report endpoint using MongoDB aggregation pipelines to compute flag rates, status breakdowns, and most-corrected records in the database rather than in Node.
- Deployed the API to Render and connected it to the Netlify frontend and Atlas cluster, debugging a 502 down to an IP whitelist issue by reading the deploy logs.

Keyword Compass

Solo Development • keywordcompass.netlify.app • Vanilla JavaScript, Google Gemini API

- Built an AI keyword research tool that takes a seed keyword and returns four clusters grouped by search intent, each with a topical fit score and a content angle suggestion.
- Applied a published SEO taxonomy (Money, Brand, Compound keywords and tail length) to classify every generated keyword, connecting my SEO practice to the code.
- Documented honest limitations up front: AI output is a starting point, real volume data still comes from Ahrefs or Semrush, and a production build would proxy the API key through a backend.

Tech Store Manager

Solo Development • Node.js console application

- Built a terminal shopping app covering browse, category filter, search, cart management, and checkout with a 12% VAT receipt.
- Wrapped readline in a Promise so the main loop runs on async/await, and validated product IDs and quantities so bad input fails cleanly instead of crashing.

EXPERIENCE

Web Developer & Lead SEO Strategist

September 2023 to Present, Manila

- Lead a remote team of SEO specialists, media buyers, writers, and designers serving 100+ brands across e-commerce, SaaS, logistics, and professional services, with over \$500K, EUR 2.3M, and PHP 100M in tracked client sales.
- Deliver an average 70% organic traffic lift within the first six months of an engagement through technical audits, content roadmaps, and link acquisition.
- Selected results: grew a logistics client from 100 to 5,000+ monthly organic sessions in six months with 70+ qualified leads; ran e-commerce SEO and ads to EUR 1.31M revenue across 6,736 orders in twelve months; analyzed \$24.1M in Meta ad spend and identified 5 to 7 second product reveal timing as the strongest creative lever for CTR and ROAS.

DevOps and SEO Project Team Lead | Advanced Local

August 2023 to July 2024

- Led web development operations across the full project lifecycle, delivering 40+ sites on schedule with developers, designers, and product managers coordinated on Kanban in Jira and Trello.
- Implemented CI/CD pipelines that automated deployments, cutting release times and reducing downtime, and monitored performance post-launch.

Project Manager | Shop Dog Marketing

January 2024 to April 2024

- Managed SEO and web development projects from concept to completion and wrote SOPs that lifted team output.

SEO Specialist / SEO Associate | Dollarmize; Big Catch Digital

February 2020 to March 2023

- Ran keyword research, on-page optimization, technical audit fixes, and link building outreach across client sites. Earlier campaign work for Door and Gate Domination, Redfern Media, and Aureas Media.

SPEAKING AND COMMUNITY

Organizer, Chiangmai SEO • Attendee, SEO Mastery Summit Saigon 2024 • Speaker, SEO Baguio 2024 • Guest Speaker, TFMT SEO Masterclass • Attendee, Masterclass Mastermind, WOSCON 2023

EDUCATION

Full Stack Web Development | Uplift Code Camp, Batch 29 — 2026

Bachelor of Science in Civil Engineering | Mapua University — 2015 to 2022
